

## > For your motor feeders

### Okken 70-M: The compact and powerful cubicle

The 70-M cubicles satisfy the motor control needs of the most demanding processes. By concentrating more equipment and functions in the same space, Okken reduces the overall number of cubicles. You thus optimise installation cost and reduce civil engineering costs, while also reducing the space reserved for electrical distribution equipment.

#### An innovative solution...

- With a 70-M cubicle of the same size, you can now install more motor feeders.
- The 70-M cubicle lets you combine functions, for example incomer and feeders.
- It is adapted to all electrical room configurations.
- A pre-studied solution, it incorporates all Schneider Electric tried and tested products for all motor applications...

#### ... rugged and reliable...

- Creation of new withdrawable drawers with larger useful volume was made possible by:
  - Schneider Electric's know-how in LV equipment design in very small volumes,
  - Use of Schneider Electric last generation products,
  - Perfect electrical and mechanical consistency and the electromagnetic compatibility of all components.

- The drawers are equipped with a real test position accessible automatically by simple displacement, thus guaranteeing power upstream and downstream insulation for maximum operator safety.

#### ... and secure

- All the devices are locked to prevent incorrect manoeuvres.
- The drawers can be plugged out with power on, without stopping the switchboard and without risk to the operator.
- On the front face, the switchgear position mechanical indicators are 100% reliable.

Your activity evolves...  
With Okken, nothing  
stops you from adding  
new motor feeders.
